Control-M Managed File Transfer

Simplify and automate file transfer management
in hybrid and multi-cloud environments

KEY FEATURES

Centralizes and automates internal and external file transfers and simplifies scheduling

Aligns file transfers with business processes

Provides instant visibility into the status of file transfers with an operational dashboard and file transfer search

Delivers robust support for AWS S3, FTP, SFTP, and AS2

Ensures data integrity with FIPS compliance and policy-driven processing rules

KEY BENEFITS

Improves services levels by aligning both internal and external file transfers with business process flows in a single view

Reduces business service risk and remediation costs with a single, integrated view for file transfers and workflows, including predictive analytics and proactive notifications

Maintains regulatory compliance by providing authorized users secure and easy access to current and historical file transfers and related business services

Proactively supports lines of business by quickly remediating file transfer-related issues before they negatively impact the business
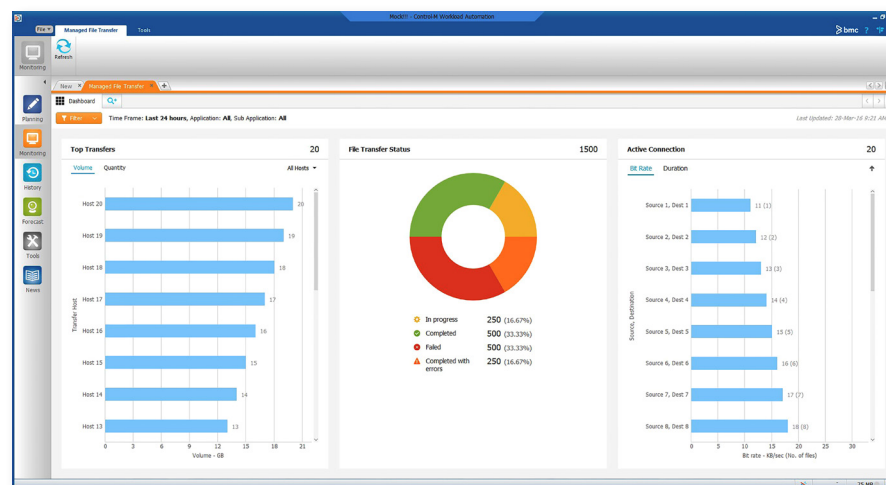

PRODUCT DESCRIPTION

Control-M Managed File helps you reduce risk and deliver business services faster by automating internal and external file transfers in a single view, with related application workflows on-premises, in the cloud, or both.

BUSINESS CHALLENGE

Modern business operations depend on the movement of files between many different applications, systems of record, and external business partners. Using a combination of scripting, proprietary applications, and manual intervention creates unnecessary risk, resulting in potential SLA breaches with high remediation costs.

BMC SOLUTION

Control-M Managed File Transfer puts you in control of file transfers with an intuitive graphical user interface to guide you through job definitions and ensure transfers are associated with comprehensive automated workflows. You get instant visibility into the status of internal and external file transfers with a dashboard view, enhanced security with encryption options, and reduced risk of downtime with automated monitoring and recovery features.

Control-M Managed File Transfer provides instant file transfer visibility, including activity on specific endpoints, throughput levels across active file transfer connections, and an overall status view of all file transfers.

PRODUCT DETAILS

Advanced search capabilities: Users can easily find details of a specific file, without needing to know the associated name of the workflow that transferred the file.

File transfer and business processes alignment: After a file transfer operation completes, the dynamic scheduling capability automatically updates the business service and initiates any downstream workflows, eliminating the need for manual intervention or complicated scripting. Automated integration ensures that any related processes are triggered on schedule and that service levels are met for workflows running in hybrid and multi-cloud environments.

Automatic recovery: When network failures or outages cause a file transfer to fail, automatically recover and restart the failed transfer from the point of failure or from the beginning. If multiple files are transferred within a single job and one file transfer fails, recover or restart only the file or files that failed.

Centralized configuration: Administrators can deploy and upgrade Control-M Managed File Transfer on every endpoint from a centralized configuration interface. They can also use the interface to manage the connection profiles to the endpoints and configure various optional settings.

Built-in file transfer server: Eliminate the need to manually configure file transfer settings on each endpoint or to use third-party file transfer servers for Microsoft® Windows® platforms. The file transfer server supports secured transfer and authentication and can be managed from the central configuration interface.

External capabilities: Provides a secure way for you to manage file transfers with external business partners in your Control-M environment.

COMPONENTS INCLUDE:

B2B Hub: File transfer server that manages external file transfers and allows for virtual users and folders that can be associated with external business partners.

B2B Gateway: Listens for incoming SFTP, FTPS, and HTTP/S connections from external accounts.

B2B File Exchange: Web-based interface that external business partners can use to connect to the B2B Gateway to upload and download files.
